Abstract (en)
[origin: WO2017103729A1] An anti-seismic connection joint (100) comprises a female element (10) and a male element (20), fixable to the respective vertical and horizontal structural components (110,120). The female (10) and male elements (20) are joined by a pin (30) to form a connection hinge (40) between the structural components (110,120). In particular, the hinge (40) is provided with both a rubber damping element (50) and at least one sacrificial element (54) with a mechanical fuse restraint function. The hinge connection joint (100) combines, in a single anti-seismic device, "fuse" type (thanks to the presence of the sacrificial element) and "damping and dissipative" type functioning (thanks to the presence of the damping element) and is thus able to adequately withstand the seismic event for its entire duration.
