Abstract (en)

[origin: WO2017108772A1] The invention relates to a fuel-operated firing device (1) for driving securing elements into a substrate, comprising at least one main combustion chamber (6) for a fuel, a driving piston (10) that can be driven out of the main combustion chamber (6) in a firing direction (15) by means of expandable gases, and a pre-chamber (25) with which an ignition device (26) is associated and in which a pressure acting on the main combustion chamber (6) can build up prior to a fuel-air mixture being ignited in said main combustion chamber (6). In order to improve the efficacy and/or functionality during the driving in of securing elements using the fuel-operated firing device (1), the pre-chamber (25) has at least two venting connections (108; 109) which are mutually spaced in an axial direction and which have passages (31, 32; 111, 112) that can be exposed conjointly in order to facilitate rapid venting of the pre-chamber (25).
