Abstract (en)

[origin: WO2017109117A1] The invention relates inter alia to a device for mechanically preventing automatic opening of a vehicle door (2) in the event of a bar (3) acting thereon, comprising a mounting clip (7) fixed to an outer door part (4) for an outer door handle (8). The mounting clip (7) has a door opening mechanism having a balancing mass (9) which is adjustably supported on the mounting clip (7) and operatively connected to the outer door handle (8) and can also be moved from a first operating position (15) into a second operating position (16) and back. A force introduction and locking element (17) is associated with the balancing mass (9), and by means of said element a movement of the balancing mass (9) from the first operating position (15) into the second operating position (16) can be prevented, limited, and/or reversed. When viewed in the direction of movement (20) of the bar (3) the force introduction and locking element (17) is advantageously supported against a door lock housing (11) fastened to the vehicle door (2).
