Abstract (en)

[origin: WO2017153115A1] The invention relates to a winding arrangement (1) for a transformer or an inductor, comprising a winding formed by a winding conductor, a solid insulation surrounding the winding and a connecting unit embedded in the solid insulation. The aim of the invention is to obtain such a winding arrangement which provides the required dielectric strength even at higher operating voltages. In order to achieve said aim, it is proposed that the connecting unit is a plug lead-through (5) and is designed to allow the connection of a cable connector.
