Abstract (en)

[origin: WO2017118763A1] A method of transmitting data comprises the steps of: authenticating the identity of a user to an application running on a mobile device; generating, with the mobile device, a one-time authorisation which is personal to the user and which contains a first network address of a first server; encoding the authorisation in an indicium; sharing the indicium with a seller of goods or services; parsing the indicium to establish the first network address and transmitting the authorisation to the first network address, together with transaction data including the address of a second server in the network; at the first server, establishing the authenticity of the one-time authorisation and, upon the basis of an authenticated one-time authorisation, sending data to the second network address.
