Abstract (en)
[origin: WO2017121971A1] The invention relates to a lower limb exoskeleton comprising two legs (2, 3), a rucksack-type frame (4) for attaching to the back of a user and for holding a load, and means for actuating the legs according to the movements of the user, each leg being connected at one end to the frame by means of a first articulated element (42, 43) and at the other end to an element (5, 6) for connection to the foot of the user by means of a second articulated element. The legs (2, 3) are telescopic and located at the rear of the body of the user during use.
