Abstract (en)

[origin: CN108942575A] The invention relates to a grinding machine for grinding a surface of an object. The grinding machine is provided with a plurality of grinding brushes supported in a manner of rotating around a rotation axis; at least one brush carrier on which the at least grinding brush is supported and supported around a carrier rotation axis in a rotary manner; and a conveying device used for conveying objects through the grinding machine at a feeding speed, wherein the grinding machine is provided with an input device and an output device. The brush rotation speed around the brush rotation axis and/or the carrier rotation speed and/or feeding speed around the carrier rotation axis can be adjusted through an input device and an expected grinding effect can be output through the output device.
