Abstract (en)

A roof window installed in an inclined roof structure with a flashing assembly covering a joint between the roof window and the roof surface, where at least the top flashing member and the side flashing member each has a first leg lying substantially in plane with the roof surface and a second leg extending at an angle with respect to the first leg, said angle being larger than 90 degrees on the exterior side of the flashing member. The first leg of the side flashing member is adapted for extending above the outer side of the top frame member and resting on a batten of the roof structure above the roof window seen in the direction of inclination of the roof structure. The flashing assembly may further include at least one top corner flashing member adapted for overlapping the top flashing member and a side flashing member.
