Abstract (en)

[origin: EP3404633A1] An apparatus for monitoring atmospheric characteristics and detecting fires, including an electronic unit provided with a means for detecting the presence of smoke in an environment to be protected, a means for detecting the quantity of carbon monoxide, and a means for detecting the temperature. The particularity of the apparatus resides in that the electronic unit furthermore includes a partial or complete combination of means for detecting the quantity of oxygen, means for detecting the relative humidity, means for detecting the differential pressure, means for detecting the carbon dioxide and means for detecting the quantity of volatile organic compounds (VOCs) present in the environment; the electronic unit, with all the related detection means, is operatively connectable to a remote central control unit and can be supplied by means of a power source.
