Abstract (en)
[origin: WO2017125218A1] The invention relates to a method for packaging articles, piece goods or containers (12) and/or for grouping the articles, piece goods or containers (12) to form packages (32) via the multi-layered helical wrapping of the articles, piece goods or containers (12) transported in a conveying direction (18) in an article or piece goods flow (14) and/or of the groupings about a longitudinal axis running through the article or piece goods flow (14) by means of flexible film applied under tension. In this way, a film package (30) of the articles, piece goods or containers (12) continuously moving in the conveying direction (18) is formed, which is provided with perforations in planes perpendicular to the longitudinal axis and/or which is cut between successive articles, piece goods, containers (12) or article, piece goods or container pairs or groups of multiple articles, piece goods or containers (12) conveyed next to one another, forming packages (32) conveyed behind one another. The packages (32) that are separated from one another are sorted in downstream transport and/or handling stations (34), and assembled, palletised and/or stacked in layers, wherein the film packaging (30) is cut at respective defined and/or variable distances to preceding cutting points in order to separate packages (32) of variable sizes or packages (32) having a variable number of articles, piece goods or containers (12) assembled with film.
