Abstract (en)  
[origin: EP3406161A1] Disclosed is a mechanism. The mechanism includes an inner-body and a spiral; limiting steps for limiting an axial movement of the spiral are provided on an outer wall of the inner-body; the spiral is provided with an annular elastic telescopic portion; and the elastic telescopic portion is provided with a plurality of grooved holes arranged along a circumferential direction of the elastic telescopic portion, thereby forming an oblique elastic deformation strip between adjacent grooved holes. According to the mechanism, by providing holes on a sidewall of the spiral to form the elastic telescopic portion, the mould opening is relatively easy and the manufacturing cost is low; the elastic deformation strip is provided obliquely, so to achieve the same telescopic amount of the spiral, the elastic deformation strip is required to have a relatively small deformation compared with the existing structure. Therefore, an irreversible deformation is not easily occurred.
