Abstract (en)  
In a case where an area of a captured image captured using a fisheye lens is designated, a generation unit generates a display image based on a position of the area designated in the captured image. The display image is an image in which the captured image is rotated about a predetermined position in the captured image so that a state of a subject included in the area becomes more erect. A display control unit causes the display image generated by the generation unit to be displayed on a display unit.
