Abstract (en)
[origin: WO2017129158A1] The invention relates to a pivoting bolt lock comprising a housing (2) in which a pivoting latch (1) is mounted in a pivotal manner between an open position and a closed position by means of an adjusting device. The pivoting latch (1) is completely received in the housing (2) in the open position, and a locking element (21) of the latch protrudes out of the housing (2) through an opening (20) in the closed position. The invention is characterized in that the adjusting device has a spindle drive (8) which drives a spindle (7). The spindle (7) is equipped with a threaded socket (6) which is arranged in a locking bow (4) rotatably mounted in the housing such that the locking bow (4) can be pivoted between a locking position and a release position. The locking bow (4) is connected to a lever (3) which engages into a blocking recess (22) of the pivoting latch (1) in the locking position of the pivoting latch (1) and in the locking position of the locking bracket and disengages from the blocking recess (22) in an open position of the pivoting latch (1) and in a release position of the locking bow (4).
