Abstract (en)

[origin: WO2017129891A1] The invention relates to a handle device (4) for an opening element of a vehicle, comprising a support (6) for mounting on the opening element and forming a cavity (10) with an opening; and a handle (8) mounted movably on the support (6), with an inserted position in which said handle (8) extends essentially into the opening and an external position in which said handle (8) extends outside the cavity (10). The movable assembly of the handle (8) is designed to allow at least a portion of said handle (8) to enter the cavity (10) under the effect of pressure exerted on said handle (8) from the outside towards said cavity (10), so as to switch from the inserted position to the external position and to brake the glass formed between the handle (8) and the support (6).
