Abstract (en)

[origin: WO2017182541A1] The invention relates to a cam lock (1) with an actuation projection (2); a locking shaft (3) which is coupled to the actuation projection (2) and which has two opposite flattened axial regions (5) at least at the free ends (4) of the shaft and a profiled (6) circumferential design in the circumferential direction between the flattened axial regions (5); and a cage (8) which supports a closure element (7) and has an opening (9) that can be placed on the free end (4) of the locking shaft (3) and which can be fixed to the locking shaft (3). The cam lock is characterized in that a locking element (14) is provided on the cage (8), said locking element fixing the cage (8) to the locking shaft (3) in a locking position. In a release position of the locking element (14), the cage (8) can be tilted relative to the locking shaft (3), and the cage (8) can be moved in an axial direction along the locking shaft (3) exclusively in a state in which the cage is tilted relative to the locking shaft (3).
