Abstract (en)
[origin: WO2017134118A1] The invention relates to light guiding louvers with asymmetrical louvers' cross sections for deflecting light with a V-shaped folded structure. The individual folds are made of at least two folded sides b_1 and b_2 , b_3 and b_4 with at least light reflective, shiny metallic tops. Between the louvers a shadow line S results in. The light guiding louvers consist of at least two louver part-pieces 10, 11, 40, 41, a first section 11, 41 results in with light deflection essentially back into the half-space I, which lies opposite the light incident side and a second section 10, 40 with light deflection essentially in the half-space A of the incident light. The sum of folded sides $\sum b_4$ of the folds W14 to W16, W33, W34 in the first section 11, 41 is larger and the sum of the angled folded sides $\sum b_3$ is smaller. The sum of the folded sides $\sum b_4$, divided by the sum of the angled folded sides $\sum b_3$ in the first section 11, 41, is larger than the sum of the folded sides $\sum b_1$, divided by the sum of the angled folded sides $\sum b_2$ and is likewise larger than the sum of the folded sides $\sum b_2$, divided by the sum of the folded sides $\sum b_i$ in the second louvers' section 10, 40. The sum of the width of folded sides $\sum b_1, \sum b_4$ divided by the number of folds n within equal size of sections of profile cross-sections, each in the same distance from the louver centre 29 is larger in the first section 11, 41 and smaller in the second section 10, 40 ($\sum b_4 / n > \sum b_1 / n$).
