Abstract (en)

[origin: WO2017138857A1] Described are, among other things, methods and devices that set a reference position for a braking element (16) used in a yarn feeder (10). The methods and devices as described herein makes it possible to know exactly the position when the braking of the yarn starts to act and thereby establish a reference position that is known by a system that then sets the desired braking force electronically based on the reference position. Hereby it is possible to have a predictable and repeatable electrically set braking force without making use of a downstream yarn tension sensor.
