Abstract (en)
A cosmetic material container constituted by a main body (2) and a lid member (3) is configured such that one of abutment surfaces (33) and (222) that abut each other when fitted is a cam surface (332) and the other is a follower surface (224). The cam surface (32) and the follower surface (224) are configured to relatively move the main body (2) and the lid member (3) in a direction of a rotational axis (AX) in response to rotation of the lid member (3) with respect to the main body (2). The main body (2) and the lid member (3) move between a fitted position at which the abutment surfaces (33) and (222) abut each other and are held together by magnetic force, and a separated position at which the abutment surfaces (33) and (222) are separated from each other against the magnetic force, by rotation of the lid member (3) with respect to the main body (2).
