Abstract (en)

Heat circuit refilling device (10) comprising a water tank unit (11), the water tank unit (11) having a water tank (12), an inlet (13) through which water tank unit (11) is connectable to a water supply system, a free overflow outlet (14), a floating valve (15) having a float (16) monitoring the filling level within the water tank (12) and having a valve (17) within the inlet (13), wherein the valve (17) opens and closes as a function of the filling level monitored by the float (16). The eat circuit refilling device (10) further comprising a booster unit (18), the booster unit (18) having an inlet (19) being in communication with the water tank (12), an outlet (20) being connectable to a heat circuit, a pump (21) being connected between the inlet (19) of the booster unit (18) and the outlet (20) of the booster unit (18).
