Abstract (en)  
[origin: WO2017140970A1] The invention relates to a bicycle saddle (7) made up of a mounting (711) to be attached to the frame and a seat (720) supported by the mounting. The seat (720) is made up of two ischium-bearing surfaces, which are symmetrical relative to the longitudinal median plane and spaced apart, leaving a free longitudinal space (730). Each bearing surface is made up of a stationary ischium-bearing contour (722), made up of the edge of an opening or a recess (724) surrounding the geometric ischium-bearing point (723) in two arms (721) connected to the mounting (711). The bearing contours (722) are tilted towards the inside, towards the longitudinal median plane and towards the front of the saddle.
