Abstract (en)

[origin: WO2017141097A1] A method for desulfurizing a hydrocarbon mixture containing organic sulfur compounds comprises the steps of: a) producing a sodium dispersion b) addition of the sodium dispersion to the hydrocarbon mixture to be desulfurized c) passing the mixture of sodium dispersion and hydrocarbon mixture through a reactor, wherein the reaction conditions, in particular pressure and temperature, are chosen in such a way as to bring about a reaction of the sodium with the organic sulfur compounds in which sulfur atoms are leached out of the organic sulfur compounds and bond with the sodium. The reactor is a turbulent flow reactor, preferably a tubular reactor or an oscillating plug flow reactor having an internal screw conveyor.
