Abstract (en)  
[origin: US2018363235A1] A method and device allowing the items of laundry which are to be ironed to enter the ironer gap in a manner directed downwards. For this purpose, the inlet region is preferably arranged below the outlet region. The invention ensures a disturbance-free and crease-free entry of items of laundry to be ironed into the band ironer. In the case of band ironers, the inlet region, and outlet region have to lie tightly together in order to bring about as large a wrapping angle of the ironer body by means of the ironer band as possible. This makes the inlet of items of laundry to be ironed into the ironer gap emerging from the inlet region problematic. This invention described herein provides a solution to this problem.
