Abstract (en)
[origin: US2018376259A1] A hearing device includes a frame for insertion into a housing and for retaining hearing device components. The frame includes two frame parts being joined together or to be joined together, substantially along a partition plane and being mechanically interconnected or to be mechanically interconnected by a connecting clip. In a first variant, the connecting clip has two spaced apart and parallel pins engaging into corresponding recesses in the respective frame parts for holding the frame parts together by form-locking engagement transversely to the partition plane. In a second variant, each frame part has a pin engaging into a respective corresponding recess in the connecting clip for holding the frame parts together by form-locking engagement transversely to the partition plane. This permits the frame to be produced particularly efficiently. A connecting clip for a hearing device is also provided.
