Abstract (en)  
[origin: WO2017144290A1] The invention relates to a rail fixing system for a railway superstructure, comprising an intermediate layer and an angular guide plate which, in the mounted state, are arranged adjacent to each other transversely to the direction of the rail. Said angular guide plate comprises at least one maintaining element, the intermediate layer has at least one contact region and the at least one maintaining element is designed, in the mounted state, to secure the intermediate layer over the at least one contact region.
