Abstract (en)  
The invention relates to a heat exchanger (10) comprising a first component (20) and a second component (60), wherein the first and the second component (20, 60) are mechanically connected to one another by means of a clamping connection, and wherein the second component (60) has a flange (64), which the first component (20) encompasses with a positioned border area (22). The border area (22) of the first component (20) has a plurality of partial areas (26), which are spaced apart from the border (24) of the border area (22), which are in each case bent in the direction of the flange (64) with their free end (30), which points away from the border (24) of the border area (22), and abut the flange (64) with this free end (30).
