Abstract (en)
[origin: EP3425886A1] Methods and related systems are presented that relate to automatically avoiding address conflicts when establishing a secure communications link over a public network between a local computer, associated with a local network, and a remote computer, located outside the local network. In order to avoid address conflict, addresses reserved for use by the local network and addresses reserved for use by the remote network are determined. At least one local address is selected from among available local addresses such that the selected local address is an address that does not conflict with the reserved addresses of the local network and the reserved addresses of the remote network. The selected local address is used in connection with establishment of the secure communications link between the local computer and the remote computer.
