Abstract (en)
[origin: WO2017153125A1] The invention relates to an automatic lock for doors or the like, having a latch (2) which is subject to the action of a latch spring, and an arresting element (12) for arresting a driving-rod slide (13) which is forced into its arresting position, wherein the driving-rod slide (13) controls at least one bolt (3) in the locked and unlocked position of the same, and wherein the driving-rod slide (13) is released, and the bolts (3) pass into the locked position, by virtue of a trigger (8) of the arresting element (12), said trigger projecting on the lock-case-front side and striking against the striking plate. In order to achieve a safe release with low production outlay, it is provided that the trigger (8) is a two-armed pivot lever, whose first arm (9) is formed by a sensing arm (10) and whose second arm (11) forms an arresting element (12) for the driving-rod slide (13) and is received in the slotted latch bolt (14).
