Abstract (en)

[origin: WO2017155774A1] Embodiments include methods, systems and computer program products for risk and decision analysis for a cold chain system. For example, a method includes receiving input parameters at a decision engine, generating a recommendation signal that includes a route and a schedule using the input parameters, calculating a risk value for the route and the schedule, comparing the risk value versus a risk threshold, generating a notification for requesting user input in response to the risk value being equal to or greater than the risk threshold, transmitting the notification and recommendation signal that includes the route and schedule to a user device, receiving a user selection from the user device based on at least the notification and recommendation signal, storing the user selection in a network database, instructing cold chain system to execute a logistics event based on the user selection, and storing the logistics event and outcome.
