Abstract (en)
[origin: WO2017158451A1] In a device for cardiopulmonary massage and/or resuscitation of a patient, which has a massage device (14) arranged on a support board (12) and comprising a reversibly drivable massage stamp (16) that can be positioned at a desired contact area (17) on the thoracic cage (18) of the patient (11) for performing cardiopulmonary massage, the invention proposes the provision of a retention plate element (19) which can be positioned on the thoracic cage (18) of the patient (11) at the desired contact area (17) and which, by means of at least three clamping elements (20) engaging on its circumference, can be fixed, in particular can be connected to and braced by the support board (12). This has the effect that the mechanical cardiopulmonary massage can be maintained upright even during difficult transport manoeuvres, since the relative position of the patient with respect to the massage device is not appreciably changed by its being clamped between the support board and the retention plate element.
