Abstract (en)

[origin: WO2017157870A1] Device for a timepiece, comprising a one-piece mechanism (13) that includes a support (15) and an inertial adjusting element (29, 30) which is connected to the support by a flexible suspension (31; 36, 55). The flexible suspension includes a flexible adjustment link (36, 55), one end of which is adjustable relative to the support in such a way that the overall stiffness of the flexible suspension, and thus the oscillation frequency of the inertial adjusting element, changes.
