Abstract (en)

[origin: WO2017160454A1] This disclosure describes, in part, cloud-based generation of receipts using transaction information. In some examples, a payment service can send receipt templates to a point-of-sale (POS) device of a merchant, receive an indication of a selected receipt template from the POS device, and associated the selected receipt template in a merchant profile of the merchant. The payment system can then receive transaction information from the POS device of the merchant, generate a receipt for the transaction using the selected receipt template associated with the merchant profile, and send data representing the receipt to the POS device. In some examples, the receipt template defines a layout of the receipt, text to include in the receipt, and one or more graphics to include in the receipt.
