Abstract (en)

[origin: CN209359900U] The utility model relates to a device for manufacturing a bristle bundle. To this end, a device (1) for producing a bristle bundle (2) is proposed. At least one conveying element (3) is provided in the device, said conveying element having at least one outer release opening (4) for releasing at least one outer partial bundle (5) of bristle bundles (2) to be produced and at least one inner release opening (6) for releasing an inner partial bundle (7). The aim of the utility model is to achieve a clear separation of different bristle filaments introduced into the bristle bundle (2) by means of the at least two different partial bundles (5, 7) in the produced bristle bundle (2). It is stipulated that the at least one external release opening (4) surrounds the at least one internal release opening (6) of the conveying element (3) on the peripheral side by the surrounding degree of at least 66% on the whole, and according to the device, the bristle area is allowed to be of a more specific and more flexible structure when a brush or a broom is manufactured.
