Abstract (en)

[origin: EP3431676A1] The invention relates to a closure device (100) characterized in that it comprises a lower rail (12), a lower pivot (1) fastened to the lower rail (12), a fixed door (58) and a sliding door (52). The lower pivot (1) comprises a selective retention element (104) and a guide element (103) that comprises a lower longitudinal passage slot (105) with a width and lower rotation space (106) with a circular shape through which the lower longitudinal passage slot (105) passes, the lower rotation space (106) having a diameter. The sliding door (52) comprises a lower fitting (2) with a lower protrusion (204). The selective retention element (104) comprises a surface (107) and an open cavity (108), accessible in a sliding direction (X), said cavity (108) comprising retention means (109) suitable for retaining the lower protrusion (204) when it is located in said cavity (108). The cavity (108) has a size equal to or smaller than the width of the longitudinal passage slot (105).
