Abstract (en)
[origin: WO2017162562A1] The invention relates to an air vent with a housing which consist of at least two parts. Furthermore, at least one opening for supplying an airflow and an opening for discharging the supplied airflow are provided. The airflow can be supplied to the air vent from an air supply shaft or from an air supply line in heating, ventilating, or air-conditioning systems, in particular for passenger compartments in motor vehicles. The housing of the air vent can be inserted into a wall opening or can be assembled behind such a wall opening and secured there via one of the at least two parts of the housing. In the non-use state of the air vent, one of the at least two parts of the housing lies in or over the other part of the housing. The airflow, which is supplied via the opening, is conducted in the housing and flows via the opening in order to be discharged. During the operation of the air vent, the at least one part of the housing lying in or over the at least one other part of the housing can be moved, drawn, or slid out of the other part or displaced, moved, or slid away from the other part.
