Abstract (en)

[origin: WO2017162789A1] The invention relates to a method for estimating the attentional resources invoked for the execution of a primary task and/or attention sharing strategies developed by an individual, said method being implemented in a mobile terminal and being based on the utilization of the dual-task paradigm, noteworthy in that it comprises the following steps: - Evaluation (10) of first performance ratings of the individual during the execution of a primary task alone, - Evaluation (20) of second performance ratings of the individual during the execution of a secondary task alone, - Evaluation (30) of third performance ratings of the individual during the simultaneous execution of the primary and secondary tasks, - Estimation (40) of the attentional demand required for the execution of the primary task and/or of the effect (beneficial or negative) of a secondary task on the control mechanisms involved in the execution of the primary task and/or attention sharing strategies developed by an individual by comparing the first, second and third performance ratings evaluated during the previous steps.
