Abstract (en)  
[origin: WO2017168103A1] The invention relates to a seat structure of a vehicle seat, comprising a frame (2) including two end plates (3) connected by two cross-members, means for adjusting the height of the frame (2), comprising a plurality of pivotably mounted links (10), a buckle part (20) coupled to one (3) of the end plates and comprising a connecting part having a clasp (21) at the upper end thereof, means for preventing the seat frame (2) from lifting when the buckle part (20) is subjected to a pull force greater than or equal to a predetermined minimum threshold, said anti-lift means comprising a toothed locking member (26) which is mechanically connected to the buckle part (20) and, when the buckle part is subjected to such a pull force, said locking member is moved against an elastic return member into a locked position in which it engages by means of notching with one (10) of the links.
