Abstract (en)
[origin: WO2017167469A1] The invention relates to a vertical SiC MOSFET (20) comprising a source connection (2), a drain connection (4) and a gate region (36) as well as an epitaxial layer (22) arranged between the source connection (2) and the drain connection (4) and comprising a first-type doping, where a horizontally extending intermediate layer (24) comprising regions (40) having a second-type doping different from the first-type doping is embedded in the epitaxial layer (22). The vertical SiC MOSFET (20) is characterised in that at least the regions with a second type of doping (40) are electroconductively connected to the source connection (2). The gate region (36) can be arranged in a gate trench (39).
