Abstract (en)
[origin: WO2018029085A1] The invention relates to a method for checking at least one press strip in terms of the respective strip width thereof, wherein the press strip in question is formed by two rotary bodies arranged against one another in a printing system (05; 06) of a rotary printing machine, by positioning a first rotary body against a second rotary body, wherein a respective colour strip is formed in the region of the respective press strip, wherein a recording of the respective colour strip is created in that: a) the respective colour strip formed on the casing surface of the second rotary body is photographically recorded by an optoelectronic device that is designed as a camera (92) of a printing plate detection system and directed towards the casing surface of the second rotary body; or b) the respective colour strip, formed on the casing surface of the second rotary body and transferred to a substrate (B) by means of a third rotary body positioned on said second rotary body, is photographically recorded by an optoelectronic device that is designed as a camera (86) of an in-line inspection system and directed towards said substrate (B).
