Abstract (en)
[origin: CN108885535A] Examples of the present disclosure describe systems and methods associated with a multi-window soft input keyboard application. A multi-window soft input keyboard application is displayed. The soft input keyboard application is used to provide application command control for one or more applications. The soft input keyboard application may comprise a first application window that displays two or more user interface elements for services of the soft input keyboard application. In examples, the first application window displays/updates based on the detected foreground application. The user interface elements are usable for application command control of the detected foreground application. An exemplary soft input keyboard application may further comprise a second application window that displays a soft input keyboard. Display of the second application window may update including replacing display of the soft input keyboard based on selection of a user interface element of the first application window. Other examples are also described.
