Abstract (en)  
[origin: WO2017174780A1] The invention relates to, inter alia, a method that is carried out via at least one device, comprising: checking whether a person for carrying out an action has spent less than or no longer than a predefined time period in a building or building section and/or only in a predefined region of a building or building section, wherein the building or the building section can be accessed via an entrance that can be secured against unauthorised access. The invention also relates to a method, carried out via at least one device, comprising: checking whether a person for carrying out an action has spent less than or no longer than a predefined time period in a building or building section, wherein the building or the building section can be accessed via an entrance that can be secured against unauthorised access. The invention further relates to a method, carried out via at least one device, comprising: obtaining information for unlocking or which is indicative of the occurrence of an unlocking of an entrance that can be secured against unauthorised access, via which a building or building section can be accessed; and providing one or more signals that permit a position in the building or building section to be deduced. In addition, the invention relates to corresponding devices and computer programs for carrying out each of the methods, as well as a system having devices of this type.
