Abstract (en)

[origin: EP3441277A1] The mechanism for lifting of the boarding plate (4) of the wagon for transportation of cars contains at least two direct mechanisms (1), which are connected to the input shaft (5), the direct mechanisms (1) are connected to the travelling pulleys through the stripes (2), the stripes (2) with the travelling pulleys are rotary connected with the sets of levers (3), the sets of levers (3) are attached to the boarding plate (4). During rotation of the input shaft (5), the direct mechanisms (1) push away the stripes (2) with the travelling pulleys, and thus they initiate change of position of the sets of levers (3), and thus the boarding plate (4), connected to the set of levers (3), is lifted. By rotation of the input shaft (5), the stripes (2) with the travelling pulleys are pushed away or pulled in, and thus an inclination of the set of the levers (3) is changed, and thus height of the boarding plate (4) is adjusted.
