Abstract (en)  
[origin: CN208470265U] A package system that is used for the manufacturing to be tied up physically by what the grouping of commodities thing constituted is disclosed. Package system includes supply portion, and the portion can not have the breadth that provides thermoplasticity packaging material discontinuously via the supply. In addition, package system responds to the reference mark's of distinguishable thermoplasticity packaging material's in the mechanism unremitting breadth actual position including responding to the mechanism, and this reference mark constructs in thermoplasticity packaging material's unremitting breadth as the breach. Still be equipped with cutting and/or separator, it is constructed to become to be used for and isolates the plane formula packing from thermoplasticity packaging material's unremitting breadth and cut out the part referring to under the actual position's that recognises with the help of response mechanism the circumstances. In addition, the thin film encapsulation module is package system's component parts, and this thin film encapsulation module is used for tailoring the plane formula packing partially applies the grouping of commodities thing to and be equipped with the shrink passageway, should contract the passageway and be used for tailoring the partial grouping of commodities thing that contracts with the plane formula of applying packing.
