Abstract (en)

[origin: CN109386220A] The invention relates to a support unit for housing a drive unit of a closing or protective device in an anti-torque manner. The mounting unit has a retaining member having a special-shaped housing member; and a connecting member matching the special-shaped housing member, the connecting member being connectable to a driving unit. The retaining member provides a first housing position and a second housing position for the connector, so that the connector can be tightened in the first housing position relative to the retaining member in the second housing position to overcome the torque. Under a force for overcoming the retaining force, the connector is movable between the first housing position and the second housing position. The invention also discloses a closing or protective device and a tool-less method for stopping the anti-torque system of the drive unit of the closing or protective device.
