Abstract (en)

[origin: WO2017178010A1] The invention relates to an electronic device (1) having a device base (2) for mounting the electronic device (1) on a support, wherein at least one pivoting arm (4) is at least partially accommodated in a holder (3) of the device base (2) and partially protrudes from the device base (2), which pivoting arm can be moved about a pivot axis (x) parallel to a contact side (5) of the device base (2), wherein a first fastener (6) is arranged outside of the holder (3) in a first position of the pivoting arm (4), and wherein a second fastener (7) different from the first fastener (6) is arranged outside of the holder (3) in a second position of the pivoting arm (4), characterized in that a cut-out (9) leading into the holder (3) is formed on a side wall (8) of the device base (2), into which cut-out a locking piece (10) is inserted, which can be moved parallel to the pivot axis (x) between a release position, in which the locking piece releases the pivoting arm (4), and a locking position, in which the locking piece fastens the pivoting arm (4) selectively in the first position or the second position. In particular, the electronic device can be a switch cabinet lamp.
