Abstract (en)

[origin: WO2017178360A1] The invention relates to a method for generating an image signal (135) to minimize travel sickness for at least one passenger of the vehicle (120). The method comprises a reading step, in which video data (130) is read from an interface to a vehicle camera (105) of the vehicle (120), the video data (130) representing a moved optical representation of surroundings of the vehicle (120). Furthermore, the method comprises a generation step, in which the image signal (135) is generated for output to an interface to at least one display means (115) arranged in the vehicle (120), the image signal (135) being generated by using the video data (130) and further video data (133). The image signal (135) is designed to simultaneously effect a display of the video data (130) on at least one subarea (140) of the display means (115) and a display of the further video data (133) on at least one further subarea (145) of the display means (115).
