Abstract (en)  
[origin: CZ306614B6] The invention relates to a hydraulic shock absorber, inside whose casing filled with a liquid, there is slidably arranged a piston connected to a piston rod, while the spaces above the piston and below the piston are interconnected by interconnection channels, in which there are arranged control elements of fluid flow, whose essence lies in the fact that, in the piston (2) of the shock absorber, there is arranged the interconnection opening (7) for controlled fluid flow between the space above the piston (2) and the space below the piston (2) with a controlling element which is connected to the hysteresis mechanism (4).
