Abstract (en)

[origin: WO2019042869A1] The invention relates to a hammer device (1), preferably a hand-operated hammer device (1), comprising a striking mechanism (13) which is designed to be able to act in a striking manner on a tool (2), preferably on a chisel (2), in the axial direction (A) along the longitudinal axis (X), and comprising at least one striking force storage element (18) which is designed to receive a striking force (D) of the striking mechanism (13) in the axial direction (A) along the longitudinal axis (X) such that same is at least partially stored, and to release said striking force again at least partially as a striking force (D') of the striking mechanism (13) in the counter-axial direction (B) along the longitudinal axis (X). The hammer device (1) also comprises a striking force diverting element (15), which is designed and is/can be arranged in the force flow between the striking mechanism (13) and the striking force storage element (18) such that the striking force (D) of the striking mechanism (13) can be released onto the striking force storage element (18) in the axial direction (A) along the longitudinal axis (X), such that same is at least partially stored, while at least partially, preferably completely bypassing the tool (2).
