Abstract (en)
The present invention relates to a refrigerator provided with a storage compartment (1) defined by thermally-insulating walls (21, 22, 23, 5), wherein a back wall (5) of said thermally-insulating walls has a channel suitable to receive a flow of cold air. The back wall (5) has one or more shutters (7) movable from a closed position, wherein they are aligned with it, to an open position, wherein they are arranged transverse to the channel and establish fluid communication between the latter and the storage compartment (1). At least one heat conduction medium (4) having a thermal conduction plate (41) and thermal convection fins (42) is associated with the back wall (5), said thermal conduction plate (41) being arranged together with thermal convection fins (42) at a through span of the back wall (5).
