Abstract (en)
[origin: WO2017190779A1] The invention relates to a sealing device of a sliding door having a slidably mounted door leaf, which sealing device has a drop-down seal having a sealing strip (11, 12) and having a lowering mechanism for automatically lowering and raising the sealing strip (11, 12). The lowering occurs against a restoring force. The sealing device also has an activation unit for activating the drop-down seal. The activation unit has a contact surface (21, 22, 29), which is directed upward in the lowering direction, and a contact element (31, 42, 51), which lies against said contact surface (21, 22, 29) during the closing of the door leaf and thereby actuates the drop-down seal, preferably the lowering mechanism. In this way, the weight of the door leaf can be used for the lowering of the sealing strip (11, 12). Furthermore, a position in which the restoring force does not influence a sliding motion of the door leaf in the longitudinal direction of the sealing strip can be achieved.
