Abstract (en)

[origin: CA3022647A1] A connecting device, in particular in the form of a hose coupling, with two coupling parts (3, 5) which are connectable to each other and are releasable again from each other and of which the one (3) uses a securing device (51) to secure a connecting hose (1) which produces a fluid-conducting connection to a connecting channel (15) of the other coupling part (5) in the coupled state, and with a sealing system (37, 71) which has a sealing ring (37) which, arranged in the region of the free end (7) of a coupling part (3), surrounds the accommodated connecting hose in a sealing manner, is characterized in that the sealing ring (37) projects over the free end (7) of the one coupling part (3) outwards towards the environment by a pre-determinable axial excess length, with a sealing surface (39) for the connecting hose (1) being formed.
